

Statistical analysis for Soybean production between the years of 1962 and 2010

Rafaela da Silva Gomes¹, Vitória Régia Lopes dos Santos², Luciene Resende Gonçalves³

Abstract: This paperwork performed a multiple linear regression analysis to test the influence of 3 independent variables on Brazilian corn production. With a reliability of 10%, the "annual soybean price" and "Brazilian GDP" variables both presented a positive coefficient with the p-value of the t test <0.0001. The "annual IGP-DI" variable presented a negative coefficient (p-value of the of 0.0632).

Keywords: Price, Regression analysis, production, Soy, statistic.
