

Description of the growth of *Eucalyptus* hybrid clones using nonlinear models

Ariana Campos Frühauf ¹, Daniela Granato-Souza ²,
Edilson Marcelino Silva ³, Joel Augusto Muniz ⁴,
Ana Carolina Maioli Campos Barbosa ⁵

Abstract: *The Gompertz and Brody models were adjusted for the growth of the genus Eucalyptus. The model that best fitted the data was the Brody (AR1), from which it was verified that the maximum average height of the trees is 16.81 m with non-sigmoidal growth pattern.*

Keywords: Autoregressive; Brody; Growth curve; Gompertz; Regression.
