Growth of peach fruits characterized by non-linear regression models

Édipo Menezes da Silva[1], Victor Ferreira da Silva[2], Felipe Augusto Fernandes[3], Joel Augusto Muniz[4], Tales Jesus Fernandes[5]

Abstract: As the initial hypothesis of this study, the growth of fresh (g) peach mass is a double sigmoid curve, and for this study, the double logistic model is the most suitable for the long cycle and the double Gompertz for the average cycle.

Keywords: Fruit development; Adjustment quality; Double Sigmoid.
